

Learnings from AstraZeneca's Open Innovation Program

Garry Pairaudeau VP Hit Discovery Discovery Sciences, IMED Biotech Unit, AstraZeneca, Cambridge, UK

February 2019

We focus on a deeper understanding of disease biology and mechanisms across three main therapy areas

2

Rationale for Open Collaboration Benefits to external collaborator and AstraZeneca AstraZeneca https://openinnovation.astrazeneca.com/ Questions Compounds Facilities Drug Discovery Knowledge that otherwise **External Scientists** could not be asked **Disease Knowledge** Patients / subpopulations Technology **beninnovation** Advancing research together

Open Innovation – Delivery

Clinical Compound Bank

Access **18** of our patient-ready compounds with evidence of human target coverage and manageable tolerability.

Preclinical Toolbox

Access **44** of our compounds with optimised pharmacological properties for preclinical research to study pathways and mechanisms of disease biology.

Target Innovation

Have a novel target idea or assay for a drug discovery project? Our diverse High Throughput Screening (HTS) compound library may help you advance or validate your idea.

Delivered:

- **30** ISS clinical validation studies
- 26 externally funded; 5 completed

Disease indication agnostic

Delivered: • 150+ projects approved

Primarily in AZ main therapy areas, but focusing on novel science Delivered: • 62 projects on-going/complete

Provides access to 250k compounds Now aligned to AZ R&D focus areas

Open Innovation – Delivery

New Molecule Profiling

Explore the properties and therapeutic potential of your novel compounds by leveraging our cheminformatic and screening technologies.

Challenges

Offer and be rewarded for your innovative ideas and research expertise to help overcome difficult R&D barriers.

Data Library

Access preclinical data sets on our early development compounds for data mining and research purposes. to enhance understanding of translation to human efficacy and safety.

Delivered:

• **30,000** natural product compounds added to AZ's HTS library

Delivered:

- 17 challenges run
- 2 collaborations delivered solutions

Launched June 2017

- Preclinical safety data
- Oncology combinations data

MRC Collaboration For Translational Research 'Mechanisms of disease' 2011

- 22 AstraZeneca compounds initially available for clinical studies
- >100 clinical and pre-clinical proposals from 37 UK institutions
- Proposals submitted on all compounds & across a broad span of disease areas
- MRC funded >\$10M
- >15 collaborative proposals funded across multiple disease areas

AstraZeneca

Investigators

and academic institutions

MRC

Medical Researcl

To investigate mechanisms of disease and the development of potential therapeutic interventions

Clinical Compound Bank How does it work?

18 compounds currently available for clinical studies44 compounds currently available for pre-clinical studies

Compound		Mechanism of action	Originating therapeutic area	Proposal type	CNS Penetrant
AZD4017	\bigcirc	11-beta-hydroxysteroid dehydrogenase type 1 (11β-HSD1) inhibitor	Metabolic Disease	Clinizal & Preclinical	Low
AZD5069	\bigcirc	Chemokine (C-X-C motif) receptor 2 (CXCR2) antagonist	Inflammation	Clinical & Preclinical	Unknown
AZD5213	\bigcirc	Histamine receptor 3 (H3) antagonist (inverse agonist)	CNS	Clinical & Preclinical	Yes
AZD5904	\bigcirc	Myeloperoxidase (MPO) inhibitor	Inflammation	Clinical & Preclinical	Low
AZD7325	\bigcirc	Gamma-aminobutyric acid receptor A alpha 2 & 3 (GABAAα2,3) positive modulator	CNS	Clinical & Preclinical	Yes
AZD9150	\bigcirc	Signal transducer and activator of transcription 3 (STAT3) antisense	Oncology	Clinical & Preclinical	Low
AZD9668	\bigcirc	Neutrophil elastase (NE) inhibitor	Inflammation	Clinical & Preclinical	Low
AZD9977	\bigcirc	Non-steroidal mineralocorticoid receptor (MR) modulator	Cardiovascular	Clinical & Pre-clinical	Unknown
Lesogaberan (AZD3355)	\odot	Gamma-aminobutyric acid receptor B (GABAB) agonist	GI	Clinical & Preclinical	Low
Saracatinib (AZD0530)	\bigcirc	Src tyrosine kinase family inhibitor	Oncology	Clinical & Preclinical	Yes

Mechanism of action: Histamine receptor 3 (H3) antagonist (inverse agonist)

Get the latest Open Innovation news

Preclinical pharmacology

AZD5213 is potent (Ki 0.5nM; dissociation KB 0.2nM), competitive, rapidly reversible, functional antagonist (inverse agonist; IC_{50} of 3nM) at the human H3 receptor. It occupies H3 receptors with an *in vivo* pKi of 8.5, 8.3 and 8.4 (free concentration in brain) for rat, mouse and NHP, respectively. AZD5213 was tested against a broad panel of 335 other receptors and enzymes at 10µM without significant activity (>50% inhibition) for any. *In vivo*, it triggers the release of histamine as well as the neurotransmitters acetyloholine, dopamine and norepinephrine in rat prefrontal cortex following dosing or 0.33mg/kg, po and increased tele-methylhistamine in the CSF of cynomolgus monkeys at 0.1mg/kg, po. At similar dose levels, AZD5213 has been shown to reverse scopolamine-induced memory deficit, increase novel object recognition, and reverse neuropathic in various rodent models.

Safety and tolerability

A2D5213 has been administered orally to healthy volunteers in single doses up to 80mg and multiple doses up to 18mg QD for 10 days. The most frequent and dosing limiting adverse effects were sleep disorder, night sweats, and decreased quantity as well as quality of sleep. Other common AEs include mild to moderate nausea and headache.

Preclinical studies of up to 6 months duration have been performed.

Clinical pharmacology

A2D5213 was rapidly absorbed (T_{max} of 0.7-2.0 hrs) after oral administration with an overall terminal tVs of 5-7 hours. In vitro studies show a low risk for DDIs. PET studies demonstrated saturable, concentration-dependent occupancy of H3 receptors with an estimated Ki,pl of 1.14nM. Receptor occupancy of ~50% was achieved at a dose of 0.1mg.

Suitable for and exclusions

Preclinical reprotoxicology data are available and have not identified any specific risks. Women of child-bearing potential using highly effective contraception can be included.

Indications and dosing regimen should consider the potential for and optimisation of efficacy while minimizing the mechanismbased adverse effect on sleep. Given the strong association between dose, plasma concentration and brain receptor occupancy as well as the rapid absorption and relatively short 115, data is available to potentially optimise benefit (day time efficacy) versus risk (night time sleep disturbance).

Strategic Partnerships *Closer collaboration, more learning*

- Based on principles of Target Innovation
- Partners bring extensive Drug Discovery expertise and experience
- Provides clear route forward for projects
- Develop long term relationship
 - Builds credibility on both sides
 - Opportunity to be more flexible
 - Can focus on specific areas of biology
- Multi-target deal simplifies contracting

COMMERCIALIZATION OF RESEARCH Institute for Research in Immunology and Cancer

Collaborative Grants Sussex University DDR Partnership

- 4-year multi-target collaboration
- Sussex University Drug Discovery Centre and AstraZeneca
- £6M funding from Welcome Trust
- Utilise Sussex deep expertise in DNA Damage Response coupled with AstraZeneca's hit identification and drug discovery capabilities

New drugs aim to kill cancer cells by destabilising their DNA $_{\mbox{Cive Cookson, Science Editor}}$

Barriers to Success

Contracting - can be slow even with a standard agreement

Resourcing and funding gaps for academic projects

Balancing innovation with organisational alignment and likelihood of success

Stakeholder engagement
